GENERAL STUDIES III

India's Satellite Supply Chain: Space Manufacturing UPSC

Faculty/Author: Faculty Editorial Board
Date: 26 November 2026
Platform: Civil Service Gurukul Research Wing
Reading Time: 5 Mins

India's growing space economy continues to face challenges associated with dependence on imported satellite components, space-grade electronics and specialised manufacturing technologies. Strengthening domestic component production, research and development, supplier qualification and testing infrastructure is essential for technological self-reliance. Civil Service Gurukul examines India's satellite supply chain, ISRO, IN-SPACe, NSIL, Indian Space Policy 2023, space-sector reforms, manufacturing challenges, strategic opportunities and the way forward, along with UPSC Prelims MCQs and Mains model answers.

Excerpt / Brief Summary

India has developed significant capabilities in space exploration, satellite development and launch vehicle technology. However, its satellite manufacturing ecosystem continues to rely on imported specialised components and materials.

A recent IN-SPACe report identifies gaps in domestic component production, procurement, testing infrastructure, skilled manpower and technology transfer.

Addressing these challenges is essential for building a resilient space economy, strengthening indigenous manufacturing and developing internationally competitive space technology companies.

For UPSC aspirants, the issue connects science and technology with industrial policy, strategic autonomy, private-sector participation and inclusive economic development.

Indian Suppliers Identified

162

Foreign Suppliers Identified

12–18 Months

Reported Critical Component Procurement Time

UPSC Syllabus Relevance

Examination Stage	Relevant Topics
Prelims	Space technology, satellites, scientific institutions, space-sector reforms and FDI policy.
GS Paper II	International cooperation, technology partnerships and strategic autonomy.
GS Paper III	Space technology, indigenisation, industrial development, investment, infrastructure and innovation.
Essay	Technological self-reliance, innovation-led development and India's scientific capabilities.
Interview	Private-sector participation, national space ambitions and industrial competitiveness.

CIVIL SERVICE GURUKUL
www.civilservicegurukul.com

1. Why in the News?

The Indian National Space Promotion and Authorization Centre (IN-SPACe) has released a report titled *Supply Chain Landscape of Satellite Manufacturing in India*.

The report, made public on 25 November 2026 and discussed in subsequent news coverage, highlights continuing reliance on overseas suppliers for critical satellite components and specialised materials.

While India's space reforms have expanded opportunities for private enterprises, domestic production capabilities remain uneven across different satellite subsystems.

Established manufacturing capabilities in selected areas have not eliminated dependence on sophisticated electronic devices, high-performance materials and other specialised technologies.

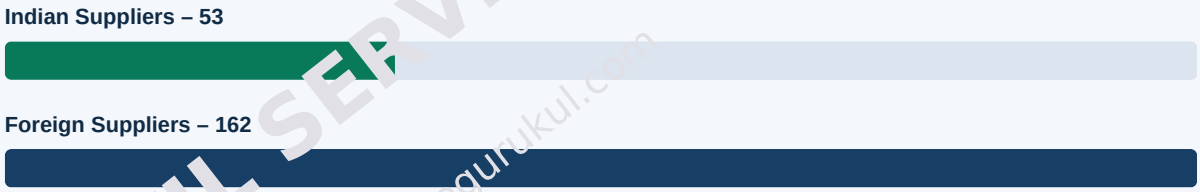
> **UPSC Current Affairs Insight:** The ability to launch a satellite domestically does not necessarily establish that all the components used in that satellite were manufactured within India.

2. Key Findings of the IN-SPACe Satellite Supply Chain Report

Indicator	Reported Finding
Report Title	Supply Chain Landscape of Satellite Manufacturing in India

Indicator	Reported Finding
Publishing Institution	IN-SPACe
Public Release	25 November 2026
Indian Suppliers Identified	53
Foreign Suppliers Identified	162
Critical Component Procurement	Frequently requires 12–16 months
Cost Contribution of EEE Components and Specialised Materials	Approximately 60% of satellite costs
Existing Domestic Strengths	Selected structural and propulsion components
Major Gaps	Testing facilities, specialised manufacturing, skilled manpower and research capabilities

Comparison of Suppliers Identified



Supplier counts identified in the reported supply-chain mapping exercise. These figures do not represent exhaustive national supplier counts or the monetary value of imports.

Important Prelims Trap: Approximately 60% of satellite costs are associated with certain electronic, electrical, electromechanical components and specialised materials. This must not be interpreted as a finding that exactly 60% of all satellite components or expenditure is imported.

The study is best understood as a supply-chain mapping exercise rather than a comprehensive statistical measurement of India's overall satellite import ratio.

3. What Is Satellite Manufacturing?

Satellite manufacturing involves designing, developing, integrating and testing spacecraft intended to operate in outer space.

A satellite generally consists of two major functional elements: the satellite bus and the payload.

CIVIL SERVICE GURUKUL
www.civilservicegurukul.com

Satellite Bus

The satellite bus contains supporting systems that enable the spacecraft to function, including its structure, power supply, communication interfaces, thermal management and attitude control.

Satellite Payload

The payload performs the specific mission for which the satellite has been developed, such as Earth observation, communication, navigation or scientific research.

Satellite Subsystem	Primary Function
Payload	Performs mission-specific functions.
Structural System	Provides mechanical support and protection.
Electrical Power System	Generates, stores and distributes electrical energy.
Thermal Control System	Maintains suitable temperatures for spacecraft equipment.
Propulsion System	Supports orbital manoeuvres and station-keeping where required.
Attitude and Orbit Control System	Maintains or adjusts spacecraft orientation and orbit.
Onboard Computer	Processes information and coordinates spacecraft functions.
Telemetry, Tracking and Command	Supports spacecraft monitoring, tracking and command communication.

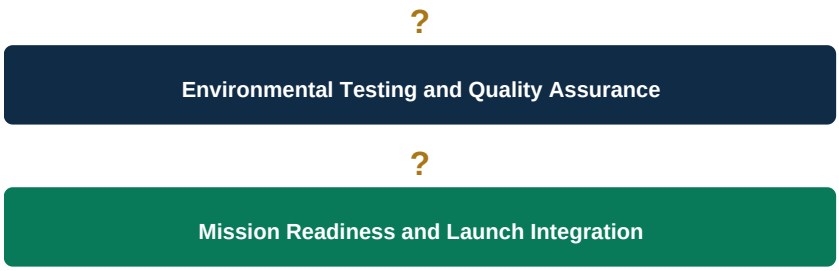
CIVIL SERVICE GURUKUL
www.civilservicegurukul.com

4. Understanding the Satellite Manufacturing Supply Chain

A satellite supply chain includes all the activities and organisations involved in producing, testing and delivering a spacecraft.

It encompasses raw materials, specialised components, manufacturing equipment, software, integration services and quality assurance.

Satellite Manufacturing Value Chain



Conceptual Clarity: Domestic final assembly and domestic component manufacturing are at different levels of technological capability. Sustainable indigenisation requires development across the complete value chain.

5. What Are Space-Grade Electronics and EEE Components?

EEE stands for Electrical, Electronic and Electromechanical components.

Space-grade components are selected and qualified to meet demanding reliability requirements associated with spacecraft missions.

Ordinary electronic equipment may not be suitable for every space application because satellites operate under environmental conditions substantially different from those experienced on Earth.

Important Characteristics of Space-Grade Components

- High reliability over the intended mission lifetime.
- Appropriate resistance to radiation exposure.
- Ability to operate within specified temperature ranges.
- Mechanical durability during launch.
- Manufacturing traceability.
- Consistent quality and validated performance.

Radiation-Hardened Electronics

Radiation hardening involves designing or selecting electronic systems to reduce susceptibility to harmful radiation effects.

Space radiation can disrupt electronic operations or contribute to gradual component degradation. The required degree of radiation tolerance depends on the mission, orbit and intended operating lifetime.

Prelims Fact: Radiation-hardened electronics are designed to improve reliability in radiation environments. They are not devices that completely eliminate radiation exposure.

CIVIL SERVICE GURUKUL
www.civilservicegurukul.com

6. Why Does India Depend on Imported Satellite Components?

A. Specialised Semiconductor Requirements

Space applications may require highly reliable electronic devices that are difficult and expensive to manufacture and qualify.

B. Limited Domestic Supplier Base

Some spacecraft components require specialised engineering capabilities and manufacturing processes that are not yet available at sufficient domestic scale.

C. High Research and Development Costs

Developing reliable aerospace components requires sustained research, specialised equipment and repeated validation.

D. Limited Testing Infrastructure

Manufacturers need access to suitable environmental testing and qualification facilities to establish confidence in component performance.

E. Low Production Volumes

Project-specific manufacturing may provide insufficient recurring demand for suppliers to invest in automated production and specialised infrastructure.

F. Skilled Manpower Constraints

Satellite manufacturing requires expertise in electronics, materials science, systems engineering, precision manufacturing and quality assurance.

G. Technology Transfer Challenges

Proprietary technologies, commercial restrictions and international export controls can limit access to certain capabilities.

> **Economic Concept:** High fixed development costs and limited production volumes can prevent domestic manufacturers from achieving economies of scale.

7. Role of ISRO, IN-SPACe, NSIL and Department of Space

India's space-sector reforms seek to combine public research capabilities with increased private participation and commercial manufacturing.

Institution	Major Role
Department of Space (DoS)	Overall policy coordination, administration and development of the national space programme.

CIVIL SERVICE GURUKUL
www.civilservicegurukul.com

Institution	Major Role
Indian Space Research Organisation (ISRO)	Research, advanced technology development, scientific missions and national space capabilities.
Indian National Space Promotion and Authorization Centre (IN-SPACe)	Promotion, facilitation and authorisation of non-government space activities.
NewSpace India Limited (NSIL)	Commercialisation of space technologies and services and facilitation of industry-led utilisation of mature capabilities.
Private Enterprises and Startups	Commercial manufacturing, innovation, product development and space-based services.

About IN-SPACe

IN-SPACe was established following the space-sector reforms initiated in 2020. It functions as an autonomous nodal agency under the Department of Space.

It facilitates participation by private enterprises and other non-government entities in India's space ecosystem, including access to relevant public-sector facilities and authorisation of eligible space activities.

About NSIL

NewSpace India Limited was incorporated in March 2019 as a Government of India-owned company under the Department of Space.

Its commercial responsibilities include promoting products and services developed through the Indian space programme and supporting industry participation.

> **Exam Trigger:**
>
> ISRO – Research and Advanced Technology.
>
> IN-SPACe – Promotion and Authorisation.
>
> NSIL – Commercialisation and Industry Participation.

8. Indian Space Policy 2023

The Indian Space Policy 2023 provides a framework for expanding India's space capabilities through collaboration between government institutions, private enterprises, research organisations and other stakeholders.

Major Objectives

- Encourage greater private-sector participation.
- Strengthen advanced research and technology development.
- Promote commercial space activities.

CIVIL SERVICE GURUKUL
www.civilservicegurukul.com

- Improve access to space-based services.
- Support innovation and industrial capabilities.
- Provide a predictable framework for space activities.
- Advance peaceful space exploration and national development.

Private companies can participate in various space activities, subject to applicable authorisations, laws and regulatory requirements.

GS Paper III Value Addition: Space-sector reforms do not imply the withdrawal of ISRO. They seek to create a broader industrial ecosystem while ISRO continues its scientific, technological and strategic responsibilities.

9. Foreign Direct Investment Policy in India's Space Sector

The Government of India liberalised space-sector FDI policy in 2024 to attract investment and promote technology development, manufacturing and commercial participation.

Space Activity	Automatic Route	Government Route
Satellite manufacturing and operation, satellite data products, ground segment and user segment	Up to 74%	Above 74%, up to 100%
Launch vehicles and associated systems or subsystems, and creation of spaceports	Up to 49%	Above 49%, up to 100%
Manufacturing components and systems or subsystems for satellites, ground segment and user segment	Up to 100%	Not required under this sectoral entry route, subject to applicable general conditions.

Automatic Route vs Government Route

Under the automatic route, prior government approval for the investment is generally not required, subject to applicable conditions. Under the government route, prior approval is required.

Foreign investment can support capital availability, international partnerships and manufacturing development. However, investment alone does not guarantee technology transfer or indigenous intellectual property creation.

Remember the FDI Sequence:

74% – Satellite Manufacturing and Operations.

49% – Launch Vehicles and Spaceports.

100% – Specified Component Manufacturing.

These percentages refer to automatic-route thresholds.

CIVIL SERVICE GURUKUL
www.civilservicegurukul.com

10. Importance of Satellite Testing and Component Qualification

Satellite manufacturing requires extensive testing because repairing an unsuitable or failed component after launch is generally difficult and expensive.

Testing Method	Purpose
Thermal-Vacuum Testing	Evaluates equipment under controlled temperature and vacuum conditions representative of space environments.
Vibration Testing	Assesses resistance to mechanical vibrations associated with launch.
Acoustic Testing	Evaluates resilience to relevant sound-pressure environments.
Radiation Testing	Assesses susceptibility to radiation-related effects.
Electromagnetic Compatibility Testing	Evaluates whether electronic equipment can function without unacceptable electromagnetic interference.
Functional Testing	Verifies that equipment performs its intended functions.

Shared and appropriately accredited testing facilities can reduce the capital burden on smaller manufacturers and improve the credibility of domestic components.

> **Important:** Indigenous components must meet mission-specific quality and reliability requirements. Import substitution should not be pursued by compromising spacecraft safety or performance.

11. Economic and Strategic Significance of Indigenous Space Manufacturing

Technological Self-Reliance

Domestic component capabilities can reduce vulnerability to external supply disruptions and strengthen technological independence.

Strategic Autonomy

Reliable access to essential satellite technologies can support continuity of nationally important space-based services.

Employment Generation

Space manufacturing creates opportunities for skilled engineers, researchers, technicians and specialised suppliers.

Startup Ecosystem Development

A stronger component supply chain can support entrepreneurs developing satellites, payloads, manufacturing equipment and downstream space applications.

CIVIL SERVICE GURUKUL
www.civilservicegurukul.com

Export Opportunities

Internationally competitive suppliers may gain opportunities to participate in global aerospace value chains.

Supply Chain Resilience

Multiple qualified suppliers can reduce the risk that shortages or restrictions affecting a single vendor disrupt an entire project.

Socioeconomic Development

Satellite capabilities support communication, agriculture, weather monitoring, disaster management, navigation and infrastructure planning.

12. Satellite Manufacturing vs Launch Vehicle Manufacturing

Parameter	Satellite Manufacturing	Launch Vehicle Manufacturing
Primary Purpose	Develop spacecraft that perform specified missions.	Develop vehicles that transport payloads into space.
Major Systems	Payloads, electronics, power systems and spacecraft control	Propulsion, vehicle structures, guidance and launch-related systems.
Operating Environment	Designed for the intended orbital or space mission.	Designed primarily for launch and payload delivery.
FDI Automatic Route	Up to 74% for specified satellite activities.	Up to 49% for specified launch vehicle activities.

Both sectors are interconnected but involve different manufacturing requirements and technical capabilities.

13. Major Challenges Facing India's Space Manufacturing Ecosystem

Challenge	Potential Consequence
Import Dependence	Exposure to foreign supply disruptions and vendor restrictions.
Long Procurement Cycles	Delayed spacecraft development and commercial deployment.
Limited Testing Facilities	Difficulties in validating domestic products.
High Development Costs	Financial barriers for emerging manufacturers.
Insufficient Recurring Demand	Reduced incentives for long-term production investment.
Technology Transfer Barriers	Challenges in acquiring or developing specialised capabilities.
Skilled Manpower Shortages	Limited engineering and manufacturing capacity.
International Competition	Pressure to meet global quality and pricing expectations.
Quality and Reliability Risk	Potential component failure and mission disruption.

CIVIL SERVICE GURUKUL
www.civilservicegurukul.com

Balanced Analysis: Import dependence creates strategic risks, but international collaboration can also provide access to advanced technologies, diversified suppliers and commercially competitive products. Self-reliance should not be equated with complete economic isolation.

14. Way Forward: Building Atmanirbhar Space Manufacturing

Component-Level Supply Chain Mapping

Identify critical technologies, vulnerable procurement categories and realistic domestic manufacturing opportunities.

Expand Shared Testing Infrastructure

Develop accessible radiation, vibration, thermal-vacuum and component qualification facilities for industry.

Phased Indigenisation

Establish realistic domestic procurement objectives linked to technical validation and demonstrated reliability.

Strengthen Semiconductor and Materials Research

Support specialised electronics, precision manufacturing and advanced materials development through sustained research partnerships.

Provide Predictable Commercial Demand

Appropriate long-term procurement commitments and aggregation of demand may encourage suppliers to invest in production capacity.

Promote Space Manufacturing Clusters

Develop industrial ecosystems connecting component suppliers, laboratories, universities and spacecraft manufacturers.

Strengthen Human Resource Development

Expand training in aerospace engineering, electronics, embedded systems, materials science and quality assurance.

Encourage International Technology Collaboration

Pursue mutually beneficial partnerships that support domestic capability development while maintaining access to qualified international suppliers.

Monitor Measurable Outcomes

Assess progress through qualified domestic supplier numbers, procurement lead times, component reliability, domestic value addition and export performance.

CIVIL SERVICE GURUKUL
www.civilservicegurukul.com

15. UPSC Prelims 2027 – Quick Revision

- IN-SPACe functions under the Department of Space.
- India's major private-sector space reforms were initiated in 2020.
- Indian Space Policy was released in 2023.
- NSIL was incorporated in March 2019.
- India liberalised space-sector FDI policy in 2024.
- Automatic FDI threshold for specified satellite activities: 74%.
- Automatic FDI threshold for specified launch vehicle activities: 49%.
- Automatic FDI for specified component manufacturing: 100%.
- EEE stands for Electrical, Electronic and Electromechanical components.
- Satellite payload performs the mission-specific function.
- Satellite bus provides supporting operational systems.
- Thermal-vacuum testing evaluates equipment under controlled vacuum and temperature conditions.
- Radiation hardening improves resistance to radiation effects.
- The recent IN-SPACe report identifies 53 Indian and 162 foreign suppliers.
- Procurement of critical components frequently requires 12–16 months.
- Supplier counts should not be confused with import expenditure ratios.

16. UPSC Prelims Practice MCQs

Question 1

With reference to IN-SPACe, consider the following statements:

1. It functions under the Department of Space.
2. It facilitates and authorises non-government space activities.
3. It is primarily responsible for conducting all of India's scientific space missions.

Which of the statements given above are correct?

A. 1 only

B. 1 and 2 only

C. 2 and 3 only

CIVIL SERVICE GURUKUL
www.civilservicegurukul.com

D. 1, 2 and 3

Reveal Correct Answer and Explanation

Correct Answer: B – 1 and 2 only

IN-SPACe operates under the Department of Space and promotes private-sector participation. Scientific space missions and advanced space research remain important responsibilities of ISRO.

Question 2

Consider the following pairs regarding automatic-route FDI in India's space sector:

Activity	Automatic Route
1. Satellite manufacturing and operation	74%
2. Launch vehicles and spaceports	49%
3. Specified satellite component manufacturing	100%

How many of the above pairs are correctly matched?

A. Only one

B. Only two

C. All three

D. None

Reveal Correct Answer and Explanation

Correct Answer: C – All three

The space-sector FDI policy introduced differentiated automatic-route thresholds of 74%, 49% and 100% for the specified activities.

Question 3

Which of the following best explains the purpose of thermal-vacuum testing in satellite manufacturing?

A. To determine the population density around the launch site.

CIVIL SERVICE GURUKUL
www.civilservicegurukul.com

B. To evaluate equipment performance under controlled vacuum and temperature conditions.

C. To eliminate all radiation from outer space.

D. To determine the financial valuation of a satellite company.

Reveal Correct Answer and Explanation

Correct Answer: B

Thermal-vacuum testing helps evaluate spacecraft equipment under environmental conditions representative of relevant space operating requirements.

Question 4

With reference to the recent IN-SPACe satellite supply-chain report, consider the following statements:

1. The report identifies both domestic and overseas component suppliers.
2. It highlights lengthy procurement cycles for critical components.
3. The number of foreign suppliers directly establishes the percentage of satellite expenditure spent on imports.

Which of the statements given above are correct?

A. 1 and 2 only

B. 2 and 3 only

C. 1 and 3 only

D. 1, 2 and 3

Reveal Correct Answer and Explanation

Correct Answer: A – 1 and 2 only

The report maps suppliers and procurement challenges. Supplier counts do not establish import expenditure because suppliers differ in product value, sales volume and commercial significance.

Question 5

Which of the following measures would most effectively strengthen indigenous satellite component manufacturing?

A. Replacing all physical qualification tests with computer simulations.

CIVIL SERVICE GURUKUL
www.civilservicegurukul.com

B. Eliminating all international research collaboration.

C. Using ordinary commercial components without validating mission suitability.

D. Developing qualified domestic suppliers and accessible testing infrastructure.

Reveal Correct Answer and Explanation

Correct Answer: D

Domestic supplier development, testing and independent qualification strengthen manufacturing reliability while reducing avoidable import dependence.

17. UPSC Mains Answer Writing Practice

GS Paper III – Science and Technology

Question: Despite India's achievements in space technology, its satellite manufacturing supply chain remains dependent on imported components. Examine the challenges and suggest measures to strengthen indigenous capabilities.

Marks: 15 | **Word Limit:** 250 words

Reveal Model Answer

Introduction

India has developed significant capabilities in satellite development, launch vehicles and space applications. However, the recent IN-SPACe supply-chain study highlights continuing dependence on overseas suppliers for critical satellite components and specialised materials.

Body

Major challenges include:

- Limited domestic production of space-qualified electronics and advanced materials.
- Lengthy procurement cycles and vulnerability to external supply disruptions.
- Insufficient testing and component qualification infrastructure.
- High research expenditure and limited economies of scale.
- Shortages of skilled professionals and barriers to technology transfer.

India should pursue a comprehensive indigenisation strategy involving:

- Component-level supply-chain mapping and phased localisation.

CIVIL SERVICE GURUKUL
www.civilservicegurukul.com

- Shared radiation, thermal-vacuum and vibration testing facilities.
- Research collaboration between ISRO, industry and academic institutions.
- Predictable procurement demand and support for domestic component manufacturers.
- Specialised manufacturing clusters and skill development.
- Strategic foreign investment and mutually beneficial technology partnerships.

Domestic manufacturing objectives must be linked to internationally competitive quality standards, independent validation and reliable spacecraft performance.

Conclusion

A resilient space manufacturing ecosystem requires capabilities beyond satellite assembly. By combining indigenous innovation, industrial competitiveness, quality assurance and international cooperation, India can strengthen technological autonomy and become a more reliable participant in global space value chains.

GS Paper III – Indian Economy

Question: Discuss the significance of private-sector participation and foreign investment in strengthening India's space manufacturing ecosystem.

Marks: 10 | **Word Limit:** 150 Words

Reveal Suggested Answer

Private-sector participation can expand India's space manufacturing capacity, accelerate commercial innovation and develop specialised component supply chains.

Indian Space Policy 2023 provides a framework for broader participation, while the liberalised FDI policy can support access to capital, technology partnerships and international markets.

IN-SPACe facilitates and authorises non-government activities, NSIL supports commercialisation and ISRO continues advanced research and technology development.

However, private investment alone cannot resolve gaps in testing infrastructure, skilled manpower, intellectual property development and recurring commercial demand.

India should therefore combine regulatory predictability, research partnerships, qualified supplier development and appropriate procurement support. Foreign investment should complement domestic technological capability rather than create new forms of dependency.

18. Important Essay Topics for UPSC

- Technological self-reliance as a foundation of national development.

CIVIL SERVICE GURUKUL
www.civilservicegurukul.com

- Innovation-led manufacturing and the future of India's economy.
- Science, technology and strategic autonomy in an interconnected world.
- Public-private collaboration as an instrument of national transformation.
- Self-reliance does not mean technological isolation.

19. Frequently Asked Questions

Why is India's satellite supply chain dependent on imports?

India faces gaps in specialised electronic components, advanced materials, manufacturing capabilities and testing infrastructure, contributing to reliance on overseas suppliers.

What is the latest IN-SPACe satellite manufacturing report?

It is titled Supply Chain Landscape of Satellite Manufacturing in India and was made public in November 2026.

How many suppliers were identified in the report?

Reported findings identify 52 Indian suppliers and 162 foreign suppliers. These numbers represent the study's mapping rather than exhaustive national supplier counts.

Does India import exactly 60% of satellite components?

The reported 60% figure concerns the cost contribution of specified component and material categories. It does not establish the country's overall satellite import percentage.

What is IN-SPACe?

The Indian National Space Promotion and Authorization Centre promotes and facilitates non-government participation and authorises eligible space activities.

What is the role of NSIL?

NewSpace India Limited supports commercialisation of Indian space technologies and services and industry participation.

What are space-grade electronics?

They are electronic components selected and qualified to satisfy demanding reliability and environmental requirements for space missions.

CIVIL SERVICE GURUKUL
www.civilservicegurukul.com

What is radiation hardening?

It involves improving the resistance of electronic systems to harmful radiation effects.

What is the automatic FDI limit for satellite manufacturing and operations?

Under the liberalised space-sector policy, the automatic-route threshold for specified satellite manufacturing and operation activities is 74%.

What is the automatic FDI limit for launch vehicles?

The automatic-route threshold for specified launch vehicle and spaceport activities is 49%.

How can India strengthen domestic satellite manufacturing?

Through qualified component suppliers, testing facilities, research partnerships, skilled manpower, predictable procurement and phased indigenisation.

Why is this topic important for UPSC 2027?

It connects space technology, indigenous manufacturing, economic development, industrial policy, investment and strategic autonomy, particularly under GS Paper III.

CIVIL SERVICE GURUKUL
www.civilservicegurukul.com

20. Conclusion

India's achievements in space science and satellite launch capabilities provide a strong foundation for the development of an advanced space manufacturing economy.

However, building a resilient satellite supply chain requires strengthening component manufacturing, specialised electronics, testing infrastructure, skilled manpower and technology development.

Government institutions, private enterprises, universities and international partners must work together to improve domestic capabilities without compromising mission reliability or commercial competitiveness.

> **Civil Service Gurukul – Final Takeaway**
>
> India's next phase of space development must move beyond successful missions and final satellite assembly towards reliable component-level manufacturing, indigenous innovation and globally competitive industrial capabilities.
